Professional Profile

Senior software engineer and Tech Lead with 8+ years at Amazon building a multi-tenant case management platform used across support, investigations, and compliance. My career has included work on frontend, distributed storage, and most recently, ML + HITL systems built on top of the platform.

Work Experience

Amazon

Seattle, WA

Senior Software Engineer

May 2024 - Present

- Tech Lead for a novel system used to detect, monitor, and route clusters of related customer contacts located across previously unconnected case management systems. Led a 10 member cross-functional team across applied science and engineering to deliver both a production-ready system in a 3 months, enabling business teams to establish the first ever cross-organizational Time-to-Resolution for cases (2026 SVP-level goal). This system is projected to save an estimated \$50M in operational cost via root-cause contact reduction in 2026.
 - Architected distributed graph-based system on AWS (Neptune, DynamoDB, ECS Fargate, Glue) ingesting from multiple authoritative sources via real-time streaming and batch pipelines; 15K peak TPS at 99.8% availability.
 - Built semantics extraction pipeline using LLMs; processed more than a billion customer contacts and annotations YTD in 2026; mentored SDEs through design and delivery
 - Architected model training + inference deployment pipeline for similarity scoring using a siamese neural network, generating embeddings and bond strengths over candidate case pairs; also responsible for runtime optimization, input chunking, and load testing
 - Built auditing interface and data pipeline to run alongside similarity model, achieving 99.4
 - Built evaluation harness for scientists to experiment on new iterations of the semantic extraction (i.e. updated prompts or LLM models), and measure downstream impact of semantic extraction on the case clusters.
- Technical leadership
 - Sr. SDE for Case Storage team (12 SDEs) and point of contact for cross-organizational projects, owning a legacy case management system serving 5K TPS and 200+ tenants across Amazon
 - Built the platform's first official documentation site (Docusaurus), consolidating fragmented wikis into version-controlled docs serving 200+ business teams

Software Development Engineer II

July 2020 – April 2024

- Technical and product lead on a fraud investigation platform, converging two standalone legacy tools into a unified platform with configurable no-code interfaces, contextual lookup, and bulk action capabilities.
 - Designed a configurable tabular widget system with dynamic data and templating, enabling tenant teams to customize investigator UX without code changes; integrated with existing widget framework for one-click contextual lookups
 - Served 3 investigation teams (Financial Transaction Fraud, Rank Abuse, Counterfeit Crimes Unit) with measurable outcomes: 13% utilization increase, 12% detection accuracy improvement, 14% false positive reduction, and 10-40% faster investigation completion
 - Enabled \$1.75M in prevented fraud losses and 973 account enforcements via Financial Transaction Fraud integration; drove 35-60% of Rank Abuse buyer/seller enforcements by integrating ML-driven workflows that replaced manual spreadsheet-based review

Software Development Engineer I

September 2018 – June 2020

Technical Skills

Languages / Frameworks Java, JavaScript, TypeScript, Python, React, Vue

AWS Services Lambda, API Gateway, DynamoDB, S3, OpenSearch, ElastiCache, ECS Fargate, Glue, Athena, Neptune, SageMaker, Bedrock

Education

The University of British Columbia

Vancouver, Canada

Bachelor of Commerce in Computer Science and Business

2018
